

Transport-Jaan Platform

Module-Wise Completion Summary

Branch: main_copy_dev

Date: 21 July 2026

Basis: full-codebase QA audit (routes ↔ controllers ↔ models ↔ migrations), updated to reflect the Warehouse module fixes shipped today and Driver Management folded into Vehicle Rental (it has no independent booking flow — driver assignment is a feature inside the vehicle vendor dashboard).

70%

PLATFORM AVERAGE

Blended completion score per major vertical, combining the customer-facing side and the vendor-management side of each module into one number.

Completion by Module

MODULE	COMPLETION	WHY
Warehouse Rental	97%	Both client and vendor sides fully wired end-to-end after today's fixes (Bookings, Settings, Payment, Tracking, and Expenses all rebuilt or repaired; an auth gap on the vendor dashboard was also closed).
Courier Shipping	92%	Client shipment flow, vendor dashboard, a real payment gateway (PayHere), and a genuine security/compliance layer. The most mature module in the codebase.
Vehicle Rental (Land / Air / Sea)	78%	Browsing, details, availability, reviews, driver-roster management, and driver-to-booking assignment are all real. Held back by checkout never actually charging anything, and a broken filter endpoint.
Authentication & Accounts	82%	Login, registration, and password reset are solid. The client dashboard has a real controller that's accidentally unreachable due to a route-ordering bug, and email verification is built but not enforced.
SuperAdmin / Admin Panel	82%	User, vendor-approval, driver, vehicle, and warehouse oversight are all real and access-controlled. Commissions/payments/reports are real. But the dashboard homepage serves a static mock instead of the real (built, unrouted) analytics controller.
Multimodal Journey	55%	The booking engine itself is the best-built piece of the whole codebase — real multi-leg availability, pricing, and transactions. But the vendor side (seeing/managing those bookings) is a mock dashboard with no real data behind it.
Ticket Booking (Train / Bus / Flight)	40%	Bus is solid (seats, cancellation, tickets). Train can book but has no seat selection despite the schema existing. Flight is a contact form pretending to be a booking flow. Vendor dashboard is mock.
Freight	30%	The public quote form works and always has. Everything past that — a real freight-company account, real bookings, a working vendor dashboard — doesn't exist in the database yet; it's a UI shell with fake bookings in it.
